

CYNGN

THE DEPLOYMENT TIMELINE

FROM VEHICLE ARRIVAL TO DEPLOYMENT, IT TAKES APPROXIMATELY 2 WEEKS TO GO LIVE.

1 Mapping

We create a virtual map of the facility with our 3D LiDAR by slowly driving the vehicle around the entirety of the facility.

2 Workflow Verification

While we map, we will work with the customer to confirm the route(s), stop points, rules of the road, and workflow the vehicle will be following.

3 Semantic Map Creation

After the map is created and the workflow is understood, we program the vehicle to abide by the parameters we've set (e.g. permissible driving zones, stop signs, stop points, etc.)

4 Safety & Performance Validation

We test the vehicle by simulating its workflow continuously to ensure all internal safety and performance thresholds are met prior to Go Live.

5 Training/Go Live

Finally, we train the staff on safe operation of the vehicle. Training takes approximately 2 hours to complete. After training, the vehicle is officially handed over to the customer.

6 Passive Monitoring

We will remain on-site for an additional day to monitor usage and to be an imediate point of support if needed.
